

Remove E-clip with small screw driver or other appropriate tool. Note the springs location; the hole further in the middle is regular lock/unlock mode and the hole further to the side of latch is "Forget It" mode to automatically lock.

Move the spring to "Forget It" mode (hole closest to the side) and ensure the spring with the shorter end is fastened with the latch and the longer end of spring fastens to the rotating metal piece.

Apply E-clip to secure pieces with pliers. You can test you have forget it mode by moving metal piece and ensuring it springs back.
